

Lumena E2E Test Document

This is a test document for Lumena Workspace end-to-end processing.

Chapter 1: The Zephyrium Crystal

The zephyrium crystal was first catalogued in 1947 by Dr. Elena Vasquez in the Atacama Desert. It has a refractive index of 3.14159 and glows with a soft blue luminescence when exposed to barometric pressure above 890 hectopascals. Only 14 specimens are known to exist worldwide.

Chapter 2: Applications

Zephyrium crystals are used in three main applications:

1. Quantum resonance imaging in medical diagnostics.
2. Calibration of deep-sea pressure sensors at abyssal depths.
3. Stabilization of atomic clocks in GPS satellites.

The largest known specimen weighs 2.4 kilograms and is housed at the Vasquez Institute in Santiago, Chile. Its market value exceeds 4.7 million US dollars per gram, making it rarer than diamond.
